PACHYSANDRA

"What can I plant in places where grass will not grow" is satisfactorily answered by advising the use of Pachysandra Terminalis, a beautiful evergreen plant growing six inches high, perfectly hardy and enduring dense shade and dry locations, as well as flourishing in direct sunlight or moist positions, making it an ideal plant for any position requiring other than grass for a ground cover.

[[The ground should be first dug and properly manured and fertilized, and the small plants set about six inches apart, given a good watering and then, if possible, an inch deep mulch of turf mold or humus. If this is done no further care is required, although occasional fertilization is beneficial.]]

Pachysandra is also a very suitable border for walks and flower beds, as it is of a low green growth at all times and may be easily kept within bounds. The price for well rooted plants is as follows:

\$5.00 per 100.

\$30.00 per 1000.

\$250.00 per 10,000.
